I have tried the print_r() and var_dump() but I am not getting any sort of result. I will add this to a database but it will be useful to see the data in a form that can be manipulated before being stored. I have tried using print_r, var_dump, print_r. Thanks. A: Try this: print_r(\$array); You can read more about the function here: var_dump is probably the way to go, though it might be considered a dump. See this link for details: Exogenous NADP as substrate for the activation of glutathione reductase by thiol reagents. The effect of NADP on the substrate activation by thiol reagents of glutathione reductase was investigated. In the presence of NADP, the thiol reagents rapidly and irreversibly inactivate the

enzyme. This inactivation can be prevented by addition of glutathione or dithiothreitol to the reaction mixture. When NADP is added after the enzyme has been inactivated by thiol reagents, the enzyme is reactivated by glutathione or dithiothreitol. Thus, the NADP-activated enzyme can be reactivated by reaction with glutathione or dithiothreitol. The inactivation of the enzyme is dependent on the NADP concentration, and this can be accounted for by a mechanism in which the enzyme binds NADP prior to addition of the thiol reagents.EAST LANSING, Mich. -- There's a question that won't be asked on Michigan State's Michigan road trip: When will the Spartans return to Szymon Jarzabkowski? The defensive coordinator has been lost for the next six to eight weeks with a leg injury. "I 82157476af
